

CMSI 401 Project Status Sheet

Spring 2018

Name:	Mackenzie Tjogas	Date:	March 18 th 2018
Project:	PurpleRun	Period Covered:	Feb 18 – March 18 th

Accomplishments since last report:

- Added to the settings page for my app
- Continued to Research different reliable sources for information to display
- Began implementing the language translation API
- Began implementing the emergency 911 call API
- Design decision on personal password vs. app-wide password
 - I chose app-wide

Scheduled tasks to be done by next report:

- Completed implementing the language translation API
- Completed Implementing the emergency call API
- Begin only letting users in to the app when they input the password
- The 911 call can only be stopped by the password being inputted
- Give all users the same password once they have logged in for the first time
- Changing the page routing from homepage to main menu, the current implementation is wrong

Noteworthy risks, concerns, or problems:

- Figuring out how to identify when it is a user's first time on the app, and therefore knowing when to direct them to the settings page and not the homepage (on their first visit).
- API implementation setbacks/issues due to unfamiliarity with Swift
 - Doing an online course/tutorial for Swift to help solve this problem
