|-----------------|------------------|------------------------|---------------------------------|
| <b>Name:</b>    | Mackenzie Tjogas | <b>Date:</b>           | March 18 <sup>th</sup> 2018     |
| <b>Project:</b> | PurpleRun        | <b>Period Covered:</b> | Feb 18 – March 18 <sup>th</sup> |

### Accomplishments since last report:

- Added to the settings page for my app
- Continued to Research different reliable sources for information to display
- Successfully implemented the 911 calling
- Design decision on personal password vs. app-wide password
  - I chose app-wide

### Scheduled tasks to be done by next report:

- Complete implementing the language translation API
- Begin only letting users in to the app when they input the password
- Make it so that the 911 call can only be stopped by the password being inputted
- Give all users the same password once they have logged in for the first time
- Changing the page routing from homepage to main menu, the current implementation is wrong
- Update documentation to reflect the recent changes/updates in design decisions

### Noteworthy risks, concerns, or problems:

- Figuring out how to identify when it is a user's first time on the app, and therefore knowing when to direct them to the settings page and not the homepage (on their first visit).
- API implementation setbacks/issues due to unfamiliarity with Swift
  - Doing an online course/tutorial for Swift to help solve this problem
